Subject	Data Usability Summary HWPW - Semiannual Site-Wide Monitoring Union Pacific Railroad (UPRR)/Houston TX-Wood Preserving Works Houston, Texas July-September 2024		

The services undertaken by GHD in connection with preparing this report were limited to those specifically detailed in the report and are subject to the scope limitations set out in the report.

1. Scope of Data Usability Summary

This document details a Data Usability Summary (DUS) of analytical results for samples collected in support of the HWPW - Semiannual Site-Wide Monitoring at the UPRR/Houston TX-Wood Preserving Works site during July-September 2024. Samples were submitted to ALS Global (ALS), located in Houston, Texas and are reported in the following data packages: HS24071470, HS24071566, HS24071691, HS24071816, HS24071855, HS24080003, HS24080208, HS24080318, HS24080337, HS24080439, HS24080441, and HS24090328. ALS subcontracted some volatile organic compounds (VOCs) analyses to Eurofins Environment Testing (Eurofins), located in Stafford, Texas. These data are reported in the following data packages: 860-80414-1 (embedded in HS24080318), 860-80415-1 (embedded in HS24080441), 860-80416-1 (embedded in HS24080337), and 860-80417-1 (embedded in HS24080439). The intended use of the data is to support the HWPW - Semiannual Site-Wide Monitoring at the site by providing current concentrations of chemicals of concern.

Data were reviewed and validated by Chris G. Knight of GHD Services Inc. (GHD)., in accordance with Title 30 of the Texas Risk Reduction Program (TRRP) Texas Administrative Code Section 350.54 (30 TAC 350.54) as described in the Texas Commission on Environmental Quality (TCEQ) Regulatory Guidance document entitled "Review and Reporting of COC Concentration Data under TRRP", (RG-366/TRRP-13), revised May 2010, herein referred to as "TRRP-13 Guidance". Evaluation of the data was based on information obtained from the chain of custody forms, finished report forms, method blank data, recovery data from surrogate spikes/laboratory control samples (LCS)/matrix spikes (MS)/duplicate analyses, field quality assurance/quality control (QA/QC) samples, the laboratory review checklist (LRC), and the laboratory exception reports (ER).

A sample collection and analysis summary are presented in Table 1. This summary provides a cross reference of field sample identification numbers and location identification. Each sample is assigned a unique field identification number.

The validated sample results are presented in Table 2. A summary of the analytical methodology is presented in Table 3. Each data packages includes a cross-reference list of field sample identifications to laboratory sample designations.

2. Laboratory Qualifications

ALS's quality assurance program is consistent with the quality standards outlined in the National Environmental Laboratory Accreditation Program (NELAP). This laboratory was accredited under Texas Certification number # T104704231 at the time the analysis was performed, and the certificate is included in Attachment A.

Eurofins's quality assurance program is consistent with the quality standards outlined in the National Environmental Laboratory Accreditation Program (NELAP). This laboratory was accredited under Texas Certification number # T104704215 at the time the analysis was performed, and the certificate is included in Attachment A.

3. Project Objectives

3.1 Sampling/Analytical QA/QC Objectives

The QA/QC program was designed to identify contamination resulting from the sampling, sample transport and analytical process through the analysis of a trip blank sample, field blank samples, field duplicate sample sets, and method blanks. The QA/QC program was designed to evaluate the quality of the resulting data with respect to bias and precision through analysis of LCS, MS, and duplicate analyses.

4. Data Review/Validation Results

4.1 Sample Holding Time and Preservation

Samples were shipped with chains of custody and the paperwork was filled out properly with the following exceptions:

i.) HS24080003: A trip blank sample was submitted but was not included on the chain of custody. The laboratory logged this sample in as WG-1620-TB01-20240730 for volatile organic compounds (VOCs) analysis. No further action was required.

ii.) HS24080208, HS24080208: Trip blank samples were submitted but were not included on the chain of custody and placed on hold. No further action was required.

iii.) HS24080318: WG-1620-FB05-20240802 was submitted with six sample containers but the chain of custody listed two sample containers. No further action was required.

iv.) HS24080318: WG-1620-FB05-20240802 was submitted with six sample containers but the chain of custody listed two sample containers. No further action was required.

All samples were properly preserved, delivered on ice, and stored by the laboratory at the required temperature (0-6°C). Sample chain of custody documents and analytical reports were used to determine sample holding times. Most samples were prepared and analyzed within the required holding times. The following holding time exceedance was noted (see Table 4):

i.) WG-1620-MW32B-20240726 was re-analyzed outside of the established holding time for VOCs due to laboratory QA/QC failures in the initial analysis. All associated sample results were qualified as estimated; biased low (JL).

4.2 Sample Containers

Sample containers used were certified pre-cleaned glass and plastic containers provided by the laboratory. These containers meet or exceed analyte specifications established in the United States Environmental Protection Agency (USEPA) *Specifications and Guidance for Contaminant-Free Sample Containers*.

4.3 Calibrations

According to the LRC, initial calibration and continuing calibration data met the criteria for the selected methods.

4.4 Laboratory Method Blank Analyses

Method blanks are prepared from a purified matrix and analyzed with investigative samples to determine the existence and magnitude of sample contamination introduced during the analytical procedures. As these were not discrete samples handled in the field, these blanks are not listed on the sample identification cross-reference- list found in the data packages.

For this summary, laboratory method blanks were analyzed at a minimum frequency of one per analytical batch and results are reported in the laboratory data packages.

Most method blank results were non-detect or below the method quantitation limit (MQL), indicating that laboratory contamination was not a factor for this investigation. The following detections were noted:

i.) Three method blanks were reported with low-level detections for methylene chloride. All associated sample results were non-detect and were not affected. No further action was required.

4.5 Internal Standard and Surrogate Spike Recoveries

Recoveries of internal standards are addressed in the LRC of the data packages. Most internal standard recoveries associated with the compounds of interest were acceptable per the LRC. The following outliers were noted (see Table 5):

i.) The following samples were reported with one or more semi-volatile organic compounds (SVOCs) internal standards recovered at less than fifty percent: WG-1620-FD04-20240731, WG-1620-MW39B-20240726, WG-1620-MW40B-20240726, WG-1620-MW-54B-20240731, WG-1620-MW-54C-20240731, WG-1620-MW75B-2024072, and WG-1620-MW-99C-2024073. The samples were re-analyzed with similar results indicating a sample matrix interference. All associated sample results were qualified as estimated (J)

In accordance with the methods employed, all samples, blanks, and QC samples analyzed for organic determinations are spiked with the appropriate number of surrogate compounds prior to sample extraction and/or analysis. Surrogate recoveries provide a means to evaluate the effects of laboratory performance on individual sample matrices. The recovery ranges established by the laboratory are adopted as the acceptance criteria for the project. Each individual surrogate compound is expected to meet the laboratory control limits. According to the TRRP-13 Guidelines, one outlying surrogate is acceptable for methods with multiple surrogate spike compounds if the recovery is at least ten percent.

Surrogate recoveries were assessed against laboratory control limits and/or the guidance in TRRP-13. Samples analyzed at elevated sample dilutions (five times or greater) were not assessed. Most surrogate recoveries met the above criteria. The following outliers were noted (see Table 6):

i.) WG-1620-MW28C-20240730 was reported with multiple low surrogate recoveries for SVOCs analysis. Associated detected sample results were qualified as estimated; biased low (JL). Associated non-detect sample results were rejected (R) due to recoveries of less than ten percent.

4.6 Laboratory Control Sample Analyses

LCS or LCS/laboratory control sample duplicates (LCSD) are prepared and analyzed as samples to assess the analytical efficiencies of the methods employed, independent of sample matrix effects. The relative percent difference (RPD) of the LCS/LCSD recoveries is used to evaluate analytical precision. The recovery ranges established by the laboratory are adopted as the acceptance criteria for the project.

For this summary, LCS or LCS/LCSD were analyzed at a minimum frequency of one per analytical batch.

The LCS or LCS/LCSD contained all analytes of interest. Most LCS or LCS/LCSD recoveries and RPDs were within the laboratory control limits, demonstrating acceptable analytical accuracy and precision (where applicable). The following outlier was noted (see Table 7):

i.) An LCS/LCSD was reported with an elevated RPD for 4-nitrophenol. Associated non-detect sample results would not be affected by the indicated variability. No further action was required. An associated detected sample result was qualified as estimated (J).

4.7 Matrix Spike Analyses

To evaluate the effects of sample matrices on the preparation process, measurement procedures, and accuracy of a particular analysis, samples are spiked with a known concentration of the analytes of concern and analyzed as MS or MS/matrix spike duplicate (MSD) samples. The RPD between the MS and MSD is used to assess analytical precision.

MS or MS/MSD analyses were performed as specified in Table 1. The recovery ranges established by the laboratory are adopted as the acceptance criteria for the project.

The MS or MS/MSD samples were spiked with all compounds of interest. Most percent recoveries and RPD values were within the laboratory control limits, demonstrating acceptable analytical accuracy and/or precision (where applicable). The following outliers were noted:

i.) An MS/MSD was reported with low recoveries and/or elevated RPDs for various SVOCs due to elevated sample dilutions and was not assessed. No further action was required.

ii.) An MS/MSD was reported with elevated RPDs for di-n-butyl phthalate and fluoranthene. Both associated sample results were non-detect and were not affected by the indicated variability.

The laboratory also performed additional MS/MSD analyses on non-site samples. These cannot be used to assess accuracy and precision for the site samples.

4.8 Duplicate Sample Analyses

Analytical precision is evaluated based on the analysis of laboratory duplicate samples. For this summary, duplicate samples were prepared and analyzed for arsenic analysis and were performed as specified in Table 1. The relative percent differences (RPD) established by the laboratory are adopted as the acceptance criteria for the project.

All duplicate analyses performed met the above criteria demonstrating acceptable analytical precision.

The laboratory also performed additional duplicate analyses on non-site samples. These cannot be used to assess precision for the site samples.

4.9 Field QA/QC Samples

The field QA/QC consisted of one trip blank sample, eleven field blank samples, and five field duplicate sample sets.

Trip Blank Sample Analysis

To evaluate contamination from sample collection, transportation, storage, and analytical activities, one trip blank sample was submitted to the laboratory for VOCs analysis. All results were non-detect for the compounds of interest.

Field Blank Sample Analysis

To assess ambient conditions at the site, eleven field blank samples were submitted for analysis, as identified in Table 1. Most results were non-detect for the analytes of interest. The following detections were noted (see Table 8):

i.) WG-1620-FB06-20240805 was reported with the following detections: di-n-butylphthalate (DBP), naphthalene, phenanthrene, and arsenic. Associated sample results that were significantly greater in concentrations than the field blank detections or were non-detect were not affected. No further actions were required. Associated sample results that were similar in concentration to the field blank detections were qualified as non-detect.

Field Duplicate Sample Analysis

To assess the analytical and sampling protocol precision, five field duplicate sample sets were collected and submitted to the laboratory, as specified in Table 1. The RPDs associated with these duplicate samples must be less than thirty percent for water samples. The RPDs are only used when sample concentrations are above the estimated regions of detection.

Field duplicate summary data are presented in Table 2. Most field duplicate results met the above criteria demonstrating acceptable sampling and analytical precision. The following outliers were noted (see Table 9):

i.) WG-1620-MW83B-20240724 and WG-1620-FD01-20240724 showed variability in several VOCs and SVOCs results. All associated sample results were qualified as estimated.

ii.) WG-1620-MW33A-20240729 and WG-1620-FD02-20240729 showed variability in several SVOCs and all associated sample results were qualified as estimated.

iii.) WG-1620-MW91A-20240730 and WG-1620-FD03-20240730 showed variability in several SVOCs and all associated sample results were qualified as estimated.

iv.) WG-1620-MW-36B-20240731 and WG-1620-FD04-20240731 showed variability in several SVOCs and all associated sample results were qualified as estimated.

v.) WG-1620-MW-54C-20240731 and WG-1620-FD05-20240731 showed variability in several SVOCs and all associated sample results were qualified as estimated.

4.10 Field Procedures

WSP USA, Inc. collected groundwater samples in accordance with their Standard Operating Procedures (SOP) for sample collection.

4.11 Analyte Reporting

The laboratory reported detected results for each analyte down to the sample detection limit (SDL), which is defined as the method detection limit (MDL) with sample-specific adjustments for dilutions, aliquot size, volumes, etc. Positive analyte detections less than the MQL but greater than the SDL were qualified as estimated (J) in Table 2 unless qualified otherwise in this report.

i.) Multiple samples were analyzes at elevated sample dilutions for VOCs and/or SVOCs analyses due to a high level of matrix interference in the sample or sample extract and/or high concentrations of target and/or non-target analytes resulting in elevated reporting limits. No further action was required.

All detectability check standard (DCS) results supported the laboratory MDLs.

5. Conclusion

Based on the assessment detailed in the foregoing, the analytical data summarized in Table 2 are usable for the purpose of supporting the HWPW - Semiannual Site-Wide Monitoring at the site with the specific exceptions and qualifications noted herein.

Project Name: Houston TX-Wood Preserving Works	Laboratory Job Number: HS24071816
Reviewer Name: Luis.Aguilar	Prep Batch Number(s): 215619,215638,215753,R473671,R474368

ER#[5]	Description
1	Semivolatiles Method SW270, samples WG-1620-MW70B-20240729, WG-1620-MW63B-20240729, WG-1620-FD03-20240730, the surrogate recoveries could not be determined due to dilution below the calibration range. Semivolatiles Method SW8270, sample WG-1620-MW28C-20240730: Surrogate recoveries were outside of the control limits due to matrix interference. Confirmed by MS and MSD
2	Batch R474368, Volatiles Method SW8260, LCS/LCSD provided as batch quality control in lieu of MS/MSD
3	Batch 215619, Semivolatiles Method SW8270, sample WG-1620-MW28C-20240730, MS and or MSD recovered outside the control limit for some analytes due to suspect matrix effect
4	Batch 215619, Semivolatiles Method SW8270, sample WG-1620-MW28C-20240730, MS/MSD RPD recovered above the RPD limit for some analytes.
5	Batch 215619, Semivolatiles Method SW8270, for some samples, the GCMS semi-volatile extract were run at a dilution due to a high level of matrix interference.

Items identified by the letter "R" must be included in the laboratory data package submitted in the TRRP-required report(s). Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.
O = Organic Analyses; I = Inorganic Analyses (and general chemistry, when applicable);
NA = Not Applicable;
NR = Not Reviewed;
R# = Exception Report identification number (an Exception Report should be completed for an item if "NR" or "No" is checked).

1	Semivolatiles Method SW8270, samples WG-1620-MW83B-20240724, WG-1620-FD01-20240724, the surrogate recoveries could not be determined due to dilution below the calibration range.
2	Batch 215486, Semivolatiles Method SW8270, LCS/LCSD RPD recovered above the RPD limit for 4-Nitrophenol. The individual recoveries met acceptance criteria.
3	Batch 215486, Semivolatiles Method SW8270 LCS/LCSD provided as batch quality control in lieu of MS/MSD
4	Batch R473087, Volatiles Method SW8260, sample HS24071595-02, MS and MSD are for an unrelated sample
5	Batch 215486, Semivolatiles Method SW8270, sample WG-1620-MW35B-20240724: Low area counts for Acenaphthene-d10, Chrysene-d12 and Perylene-d12. Sample was re-ran with similar results

ER#[1]	Description
1	Method 8260C: The method blank for analytical batch 860-182121 contained Methylene chloride above the method detection limit. This target analyte concentration was less than the reporting limit (RL) in the method blank; therefore, re-extraction and/or re-analysis of samples was not performed.

1. ER# = Exception Report identification number (an Exception Report should be completed for an item if “NR” or “No” is checked).

Job Narrative
860-80417-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable.

- Matrix QC may not be reported if insufficient sample is provided or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 8/13/2024 3:15 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 5.0°C.

GC/MS VOA
Method 8260C: The method blank for analytical batch 860-182121 contained Methylene chloride above the method detection limit. This target analyte concentration was less than the reporting limit (RL) in the method blank; therefore, re-extraction and/or re-analysis of samples was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

ER#[1]	Description
1	Method 8260C: The method blank for analytical batch 860-182121 contained Methylene chloride above the method detection limit. This target analyte concentration was less than the reporting limit (RL) in the method blank; therefore, re-extraction and/or re-analysis of samples was not performed.

1. ER# = Exception Report identification number (an Exception Report should be completed for an item if “NR” or “No” is checked).

Job Narrative
860-80415-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable.

- Matrix QC may not be reported if insufficient sample is provided or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 8/13/2024 3:15 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 5.0°C.

GC/MS VOA
Method 8260C: The method blank for analytical batch 860-182121 contained Methylene chloride above the method detection limit. This target analyte concentration was less than the reporting limit (RL) in the method blank; therefore, re-extraction and/or re-analysis of samples was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

ER#[5]	Description
1	Batch 215948, Semivolatiles by method SW8270, Multiple Samples, surrogate recoveries could not be determined due to dilution below the calibration range. Batch 215948, Semivolatiles by method SW8270, Sample WG-1620-MW18A-20240802, High %R for 2, 4, 6- Tribromophenol due to sample matrix, recovery was above 10% so the method allows for one acid surrogate to be outside detection limits.
2	Log in Notes :Sample WG-1620-FB05-20240802 @ 1530 COC states 2 bottles however collected 6 bottles in cooler Analyses of 8260 were performed by Eurofins in Stafford, TX. Report and Laboratory Review Checklist are appended.
3	Batch 215948, Semivolatiles by method SW8270, Multiple Samples: The GCMS semi-volatile extract of this sample was run at a dilution due to a high level of matrix interference.

Items identified by the letter "R" must be included in the laboratory data package submitted in the TRRP-required report(s). Items identified by the letter "S" should be retained and made available upon request for the appropriate retention period.

ER#[1]	Description
1	Method 8260C: The method blank for analytical batch 860-181781 contained Methylene Chloride above the method detection limit. This target analyte concentration was less than the reporting limit (RL) in the method blank; therefore, re-extraction and/or re-analysis of samples was not performed.
2	Method 8260C: The following samples were diluted to bring the concentration of target analytes within the calibration range: HS24080318-02 (860-80414-2), HS24080318-03 (860-80414-3) and HS24080318-12 (860-80414-12). Elevated reporting limits (RLs) are provided. Method 8260C: The following samples were diluted to bring the concentration of target analytes within the calibration range: (860-80101-D-15) and (860-80101-D-15 MS). Elevated reporting limits (RLs) are provided.
3	Method 8260C: The continuing calibration verification (CCV) associated with batch 860-182074 recovered outside acceptance criteria, low biased, for Vinyl chloride (-25.5%). A reporting limit (RL) standard was analyzed, and the target analytes are detected. Since the associated samples were non-detect for the analyte(s), the data are reported.

1. ER# = Exception Report identification number (an Exception Report should be completed for an item if “NR” or “No” is checked).

Job Narrative
860-80414-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable.

- Matrix QC may not be reported if insufficient sample is provided or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 8/13/2024 3:15 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 5.0°C.

GC/MS VOA
Method 8260C: The method blank for analytical batch 860-181781 contained Methylene Chloride above the method detection limit. This target analyte concentration was less than the reporting limit (RL) in the method blank; therefore, re-extraction and/or re-analysis of samples was not performed.

Method 8260C: The following samples were diluted to bring the concentration of target analytes within the calibration range: HS24080318-02 (860-80414-2), HS24080318-03 (860-80414-3) and HS24080318-12 (860-80414-12). Elevated reporting limits (RLs) are provided.

Method 8260C: The continuing calibration verification (CCV) associated with batch 860-182074 recovered outside acceptance criteria, low biased, for Vinyl chloride (-25.5%). A reporting limit (RL) standard was analyzed, and the target analytes are detected. Since the associated samples were non-detect for the analyte(s), the data are reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

ER#[1]	Description
1	Method 8260C: The method blank for analytical batch 860-181582 contained Methylene chloride above the method detection limit. This target analyte concentration was less than the reporting limit (RL) in the method blank; therefore, re-extraction and/or re-analysis of samples was not performed.
2	Method 8260C: The following samples were diluted to bring the concentration of target analytes within the calibration range: HS24080337-06 (860-80416-6) and HS24080337-10 (860-80416-10). Elevated reporting limits (RLs) are provided.

1. ER# = Exception Report identification number (an Exception Report should be completed for an item if “NR” or “No” is checked).

Job Narrative
860-80416-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable.

- Matrix QC may not be reported if insufficient sample is provided or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 8/13/2024 3:15 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 5.0°C.

GC/MS VOA
Method 8260C: The method blank for analytical batch 860-181582 contained Methylene chloride above the method detection limit. This target analyte concentration was less than the reporting limit (RL) in the method blank; therefore, re-extraction and/or re-analysis of samples was not performed.

Method 8260C: The following samples were diluted to bring the concentration of target analytes within the calibration range: HS24080337-06 (860-80416-6) and HS24080337-10 (860-80416-10). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

1.0 INTRODUCTION AND PURPOSE

WSP has prepared this report for Union Pacific Railroad (UPRR) to document the results of the Groundwater Plume Analytics® Services project conducted for the UPRR Houston Wood Preserving Works Facility (The Site) located at 4910 Liberty Road, Houston, Texas. WSP performed the plume analytics described herein to help provide UPRR with a baseline understanding of the stability of various volatile organic compounds (VOCs) and semi-volatile organic compounds (SVOCs) plumes at the Site. The Groundwater Plume Analytics® Services results are presented graphically in the interactive PowerPoint presentation entitled *UPRR Houston Wood Presentation 2024.pptx*, which is included as ***Appendix A***. Reference is made in this document to the interactive PowerPoint presentation in which results and summaries can be accessed through a series of menu screens when viewed in "presentation" mode.

WSP performed this plume analytics evaluation using groundwater analytical data and groundwater elevation data collected from 1984 to 2024 for the three hydrogeologic zones that are monitored at the site (A-Transmissive Zone (A-TZ), B-Cohesive Zone (B-CZ)/B-Transmissive Zone (B-TZ) and C-Transmissive Zone (C-TZ) groundwater bearing units). This evaluation included a Ricker Method® Plume Stability Analysis and Spatial Change Indicator™ Analysis (US Pat. No. 10,400,583) for each of the following constituents in the A-TZ, B-CZ/B-TZ, and C-TZ groundwater bearing units:

- 2,4-Dimethylphenol (SVOC)
- 2-Methylnaphthalene (SVOC)
- Benzene (VOC)
- Dibenzofuran (SVOC)
- Naphthalene (SVOC)

The complete analyses including graphical displays for each of the above constituents and groundwater elevation data are provided in ***Appendix A***.

2.0 GROUNDWATER PLUME ANALYTICS® METHODOLOGY

This section presents the methodologies of the elements of the Groundwater Plume Analytics® services.

2.1 Ricker Method® Plume Stability Analysis

WSP performed the Ricker Method® plume stability analysis using procedures described in *A Practical Method to Evaluate Ground Water Contaminant Plume Stability* (Ricker, 2008). The Ricker Method® plume stability analysis compares relative changes in contaminant plume characteristics over time, including area, average concentration, and mass indicator. The term "mass indicator" does not necessarily represent the entire mass in the subsurface but rather an expression of it based on a fixed assumption of aquifer thickness and porosity to serve as a meaningful way of combining plume area and average concentration into one metric. Calculation of the actual constituent subsurface mass is often a very complicated exercise, and typically more data/inputs are needed than are incorporated in this analysis. Because the plume mass value is not necessarily an indication of actual contaminant mass, the term "mass indicator" is used to describe this plume characteristic. Since the main purpose of the plume stability analysis is to observe relative changes in plume characteristics between sampling events, applying constants (i.e., porosity and aquifer thickness) to the mass calculation has no bearing on the usefulness of the output of the analysis (i.e., relative rate of change in plume mass).

To demonstrate that a plume is decreasing or stable, temporal changes in the calculated values of area, average concentration, and mass indicator should result in an overall decreasing or stable trend. An increasing trend in any of these values may indicate that the plume is not stable and/or is possibly expanding. Further details concerning trend analysis and determination of a trend conclusion are provided in ***Section 2.1.3 Statistical Methodology***.

2.1.1 Data Assessment and Input File Development

Data used in the Ricker Method® plume stability analysis for the constituents listed above are tabulated in ***Appendix B***. Groundwater analytical data were provided from 1984 through 2024. Analytical data was consolidated into semi-annual events where the maximum value (or lowest non-detect limit, if all non-detect) during the semi-annual period (per well and constituent) was retained for the analysis. Not all wells were sampled during each semi-annual period, and data gaps were filled by interpolating between sample events with actual results. Other scientific and/or statistical assumptions and adjustments to the data, consistent with the Ricker Method®, were necessary to complete the analysis. These adjustments are identified in the Ricker Method® input data set summarized in ***Appendix B***. The assumptions and adjustments used in the analysis include the following:

- Monitoring wells in which 100 percent of the data collected were non-detect for a particular constituent were assumed always to be non-detect for that constituent for sampling events in which no analytical data were reported.
- In most cases non-detect concentrations were evaluated with an assigned concentration value of the stated detection limit or, in some cases, a fraction of the detection limit (e.g., wells located far from known impacted areas). Also, in cases where non-detect concentrations with elevated detection limits were encountered, professional judgment was used. A consistent algorithm for evaluating elevated detection limits is provided in ***Appendix C***. For every case in which a sample was collected the assigned value was based on actual results (detectable value or non-detect at a lower detection limit). Assigned values for non-detect concentrations are noted in ***Appendix B***.
- For sampling events in which a monitoring well was not sampled, but prior and subsequent analytical data were available, the events were assigned values by interpolating between the closest prior and subsequent sampling event. Instances where these values are assigned are indicated by orange shading in ***Appendix B*****.**

Some monitoring wells had historical data collected but were not sampled in recent years. When this occurs, we term these wells “hanging wells”, and they are denoted by orange colored well symbols in the plume map videos in ***Appendix A*****.** In these videos, wells with black symbols signify actual or interpolated data. Once a well becomes “hanging” (i.e., no longer sampled), the well symbol turns orange signaling that empirical data are no longer available for that well location. This allows the viewer to observe where historical data were collected and where potential data gaps may exist. In some instances, hanging wells were extrapolated forward to fill data gaps in the analysis. If the assigned value is below the base contour, the orange hanging well symbol will be overlain with a blue, control point dot. This is done to allow the viewer to see in the plume map videos where these assumptions were made.

During development of the input data set, some apparently anomalous results were observed for wells in the B-CZ/B-TZ and C-TZ groundwater bearing units. For example, naphthalene was detected at a value of 1,200,000 µg/l in MW-49B in January 2020. MW-49B has been sampled 17 times since 2009 and excluding the anomalous January 2020 result, the average concentration of the remaining 16 events is 4,712 µg/l and the maximum concentration is 15,000 µg/l. Since the solubility limit of naphthalene is approximately 31,600 µg/l, it is highly improbable that the January 2020 result of 1,200,000 µg/l is representative of dissolved naphthalene in groundwater. This phenomenon (anomalously high values) was also observed for 2-methylnaphthalene and dibenzofuran in limited wells and sample events. It is

noted that this phenomenon was only observed in wells that periodically exhibit DNAPL accumulation, and it is possible that DNAPL may have been entrained in the groundwater samples.

The analysis was initially conducted using the reported values that appeared anomalous. This resulted in biased plume trends and metrics that appeared to be outliers for the events that included the anomalous values. For the final analysis shown in ***Appendix A***, rather than performing statistical outlier tests, the anomalous values were handled as follows.

In the B-CZ/B-TZ unit, all values for naphthalene and 2-methylnaphthalene were screened against the solubility limits for these constituents. If the laboratory reported value was above the solubility limit (31,600 µg/l and 25,000 µg/l, respectively) then a replacement value was assigned in the same manner as elevated detection limits. Since dibenzofuran is purported to be insoluble or have very low solubility, an assumed screening level of 9,800 µg/l was used, which is 100 times the Residential Assessment Level (RAL) for dibenzofuran. In the B-CZ/B-TZ unit, the above procedure resulted in 12 anomalous values for naphthalene, seven anomalous values for 2-methylnaphthalene, and five anomalous values for dibenzofuran. Each of these values was treated as if it was an elevated non-detect value and then a replacement value was assigned using the algorithm shown in ***Appendix C***.

No adjustments were made in the C-TZ unit, although anomalous values were observed for naphthalene and 2-methylnaphthalene in MW-45 C for the July 2022 sample event. These constituents were detected at concentrations of 15,000,000 µg/l and 4,000,000 µg/l, respectively. These values are clearly not representative of dissolved concentrations since they are both more than 160 times the solubility limits. The anomalous results can be observed in the plume metrics charts in ***Appendix A***. Since the anomalous results occurred near the end of the dataset, they had little impact on the interpretation of the trends.

2.1.2 Groundwater Plume Map Development

As part of the Ricker Method® plume stability analysis, constituent concentration isopleth maps, or plume maps, were developed using input data from the procedures described above. The following table shows the TCEQ TRRP Tier 1 residential groundwater PCLs or Residential Assessment Levels (RALs) (the lesser value between $^{GW}GW_{Ing}$ and $^{Air}GW_{Inh\text{-}V}$ PCLs), assuming a 30-acre source area and Class 2 groundwater classification (except for B-CZ wells that are considered completed in a Class 3 groundwater resource). The RALs were used to define the COC boundaries on the plume maps for each constituent in each zone.

Delineation Boundary Levels based on RAL Values (µg/L)				
Constituent	**A-TZ**	**B-TZ Class 2**	**B-TZ Class 3**	**C-TZ**
2,4-Dimethylphenol	490	490	49,000	490
2-Methylnaphthalene	98	98	9,800	98
Benzene	5	5	500	5
Dibenzofuran	98	98	9,800	98
Naphthalene	490	490	49,000	490

The constituent-specific plume area for each sampling event was calculated using the mathematical features of the contouring software used to develop the isopleth maps (i.e., Surfer® by Golden Software, Inc.). The Kriging gridding method was used with the default linear variogram to develop the isopleth maps. In some cases, wells that have always exhibited non-detect concentrations were assumed to be non-detect for that constituent prior to installation. Consistent with generally accepted scientific practices, these wells were used as control points to conceptualize the plume behavior during earlier periods where there was not enough data to conceptualize or delineate the plume. The wells used as control points are denoted by a blue dot on the plume maps (see locations in ***Appendix A***). Surfer® was also used for the computation of the average concentration of each plume as described in Ricker (2008). The plume area and average concentrations were then used to calculate the plume mass indicator for each year. To calculate the plume mass indicator, a porosity of 20% and an aquifer thickness of 10 feet were used for all units.

Concentration isopleth maps for each of the constituents listed above are included in the PowerPoint presentation in ***Appendix A***. Plume stability characteristics were calculated for each of the sampling events included in the analysis. The plume stability characteristics of area, average concentration, and mass indicator, as well as the location of the center of mass, are also provided on each isopleth map.

2.1.3 Statistical Methodology

To evaluate the stability of each constituent plume, the area, average concentration, and mass indicator for each event were plotted to observe changes in each parameter from event to event. Temporal trends of the characteristics for each plume were also evaluated statistically. The characteristics that were trended are tabulated in ***Appendix D***.

The temporal trends in the plume characteristic values were statistically evaluated using both linear regression techniques and the Mann-Kendall Test. Linear regression analyses were conducted using the

regression analysis utility in Microsoft Excel. The Mann-Kendall Tests were conducted using procedures described in Gilbert (1987). Linear regression is a parametric statistical procedure that is typically used for analyzing trends in data over time. The Mann-Kendall Test is a non-parametric statistical test; therefore, it is not dependent upon the magnitude of the data, assumptions of distribution, or regularly spaced sampling events.

The Mann-Kendall Test is used to assess whether a data set exhibits an increasing or decreasing trend at a predetermined level of significance (α). The test requires the calculation of a statistic "S" which is the difference between the number of paired differences that are positive, minus the number that are negative. If S is a large positive value, then there is evidence of an increasing trend in the data. If S is a large negative value, then there is evidence of a decreasing trend in the data. The null hypothesis, H_0, for the Mann-Kendall Test is that there is no temporal trend in the data. The alternative hypothesis, H_A, is that of either an upward trend or a downward trend.

If the null hypothesis is not rejected (i.e., no trend could be established statistically), it is expected that the plume is stable. However, a stable plume may not in fact be evident because the statistical test does not consider magnitude or variation in the data. For example, a data set can exhibit a large amount of scatter, yet the test could conclude that the plume is stable. A methodology to counter the problem of scatter in the data involves comparing the calculated S statistic, a calculated confidence factor (1-α), and the coefficient of variation for the data set. The S statistic indicates the direction of the trend, the confidence factor shows how strong the trend is, and the coefficient of variation indicates the degree of scatter in the data.

When evaluating trends using linear regression, trends may be obscured by scatter in the data. This condition is typically indicated by a low coefficient of determination (R^2) value. Even with low R^2 values (i.e., high degree of scatter) a confidence interval can still be constructed on the slope of the regression line. As described in AFCEE (2006), assuming the sign (i.e., positive, or negative) of the estimated log-slope is correct, a level of confidence that the slope is not zero can be easily determined. The overall trend in the data may thus still be determined, where low levels of confidence correspond to stable or indeterminate trends and higher levels of confidence (e.g., > 90%) indicate the stronger likelihood of a trend.

For the plume stability analysis, significant trends (increasing or decreasing) are concluded when the confidence factor is greater than 90%. If the confidence factor is less than 90%, the plume is considered stable if the regression line slope or the S statistic is negative and the coefficient of variation is less than one. If the trend is not significant and does not meet the criteria for a stable trend, the trend is considered indeterminant.

In many cases the statistical results for both linear regression and Mann-Kendall Test agree with each other. In the case where two different results are obtained (e.g., one stable trend and one decreasing trend), visual analysis and professional judgment are used to determine the overall trend result.

2.2 Spatial Change Indicator™ Methodology

The Spatial Change Indicator™ evaluation (US Pat. No. 10,400,583) shows relative changes in the plume over time. For this analysis, each plume map in a particular series is compared to the first plume map in the series by subtracting from the original plume to create a new isopleth map that shows areas of the plume that decreased in concentration (indicated by blue shading) or increased in concentration (indicated by red shading). The visual aspect of this analysis allows the viewer to observe patterns of plume behavior over time.

This analysis also has a quantitative component. Each Spatial Change Indicator™ map includes the percent change (increase or decrease) of the plume between each event and the baseline event in terms of area, average concentration, and mass indicator as calculated using Ricker Method® procedures. Additionally, for areas that increased or decreased in concentration, representative magnitudes of mass increase (red shaded areas) and mass decrease (blue shaded areas) are also included on each map. Spatial Change Indicator™ analyses for the previously listed constituents are included in ***Appendix A***.

3.0 GROUNDWATER PLUME ANALYTICS® RESULTS

This section of the report provides a summary of the results of the Groundwater Plume Analytics® evaluation. The full graphical display and analysis, including plume map videos, the Spatial Change Indicator™ results, and groundwater elevation maps, are included in ***Appendix A***. The dataset for the Site is challenging in that there have been numerous changes in the monitoring well network and analytical testing methods. Ideally, plume stability metric trend analysis would be conducted for a period with a consistent well network. This is because well network changes (adding or removing wells for analysis) can affect the plume metrics and possibly skew trend conclusions. Because of the multiple well network changes, the plume stability analysis trends may include periods with one or more network changes during the trending period. Network changes are annotated on the trend charts in ***Appendix A*** as “E” (network expansion) or “R” (network reduction).

As observed in the trend charts in ***Appendix A***, trend analyses were conducted for the analysis period of 2014 to 2024 for A-TZ, 2012 to 2024 for B-CZ/B-TZ, and 2004 to 2024 for C-TZ. The Ricker Method® plume stability analysis trend conclusions and trend date range for each of the constituents evaluated are summarized below.

N/A – Not Available

As observed above, all trends in the A-TZ zone were identified as not statistically significant or decreasing. Similarly, all trends in the B-CZ/B-TZ zone were identified as stable or decreasing. The C-TZ zone has decreasing for all trends except for average concentration for benzene. Further discussion on the trend analysis results and the Spatial Change Indicator™ evaluation results for each constituent are provided in the following sections.

3.1 2,4-Dimethylphenol

As observed above, the 2,4-dimethylphenol plume area, average concentration, and mass indicator are observed to be decreasing in both the A-TZ and B-CZ/B-TZ groundwater. Trend analyses were not performed for the C-TZ groundwater unit because there were not enough detections above the base contour to conduct a whole-plume analysis. As observed in the Spatial Change Indicator™ analyses, the 2,4-dimethylphenol plumes changed in the groundwater bearing units:

- A-TZ - The 2,4-dimethylphenol plume decreased in mass by 98% since 2014. All areas of the plume show mass decreases since 2014.
- B-CZ/B-TZ – The 2,4-dimethylphenol plume decreased in mass by 75% since 2012. The BTZ shows decreasing concentrations in all areas, except the northern edge of the plume near MW-32B and MW-70B, which are both creosote DNAPL recovery wells and typically have DNAPL present in the wells. Historic data from these wells does not indicate an increasing trend and these values are primarily below the Class 3 groundwater RAL. The majority of the mass of 2,4-dimethylphenol plume within the B-CZ groundwater unit is within the eastern delineated Class 3 unit. The only consistent historical detection within the Class 2 groundwater unit is MW-74B which has shown concentration decrease from 55,000 µg/L in 2012 to 5,800 µg/L in 2024.
- C-TZ – There is no plume in the C-TZ unit. There are only a few scattered detections of 2,4-dimethylphenol above the RAL.

3.2 2-Methylnaphthalene

The 2-methylnaphthalene plume is observed to be decreasing in all three groundwater units. Below are the observations of the Spatial Change Indicator™ analyses:

- A-TZ - The 2-methylnaphthalene plume decreased in mass by 96% since 2014. All areas of the plume show mass decreases since 2014.
- B-CZ/B-TZ – The 2-methylnaphthalene plume increased in mass by 38% since 2012. The B-TZ shows decreasing concentrations at the northern edge of the plume near MW-33BR and MW-68B. The B-TZ shows increasing concentrations near MW-32B and MW-70B, which are both creosote DNAPL recovery wells and typically have DNAPL present in the wells. An increase in concentrations since 2012 have also been seen to the south near MW-74B and MW-75B. Historical data from these wells does not indicate an increasing trend and these values are primarily below the Class 3 groundwater RAL. The majority of plume mass within the B-CZ/B-TZ groundwater unit is located within the B-CZ Class 3 delineated zone on the eastern portion of the

Site. The only plume located within the Class 2 groundwater unit is located near MW-74B and MW-75B.

- C-TZ – The 2-methylnaphthalene plume decreased in mass by 91% since 2007. All areas of the plume show mass decreases, except for MW-18C, showing localized increase of 2-methylnaphthalene above the RAL.

3.3 Benzene

As observed above, the benzene plume mass indicator is observed to be decreasing in both the A-TZ and B-CZ/B-TZ groundwater units. The C-TZ benzene plume appears to be decreasing in mass and area despite the increasing trend in concentration. Below are the observations of the Spatial Change Indicator™ analyses:

- A-TZ - The benzene plume in the A-TZ decreased in mass by 70% since 2014. The majority of the mass decrease occurred in the areas downgradient to the northeast. Smaller mass increases were observed to the southwest of the plume within and around wells MW-77A and MW-78A within the Englewood Intermodal Yard area.
- B-CZ/B-TZ - The benzene plume in the B-CZ/B-TZ groundwater unit decreased in mass 6% since 2012. A portion of increase within the plume is centered around wells MW-32B and MW-70B (both current DNAPL recovery wells) showing sharp increases in concentration from 2012 to 2018. Since 2018, MW-32B and MW-70B have shown variability in concentrations and no increasing trend. The southern and central portions of the benzene plume show decreasing mass, while the northern and eastern portions of the plume show increase in mass. The majority of the plume mass in the B-CZ/B-TZ groundwater unit is located in the Class 3 groundwater zone (B-CZ).
- C-TZ - The benzene plume in the C-TZ groundwater unit decreased by 52% in mass from 2007 to 2024. The increasing trend in concentration within the C-TZ zone is due to the decreasing area of the plume. When a plume reduces in area, the lowest concentration wells will be the first to reach non-detect and be removed from the calculation, thus the remaining wells, which may not have decreased as much, cause the average concentration to be higher. This is why it is important to consider all plume metrics together when assessing plume stability. All wells within the C-TZ zone have reduced concentrations since 2007.

3.4 Dibenzofuran

As observed above, the dibenzofuran plume mass indicator exhibits a decreasing trend in the A-TZ unit, stable in the B-TZ groundwater unit, and decreasing in the C-TZ unit. Below are the observations from the Spatial Change Indicator™ analyses:

- A-TZ - The dibenzofuran plume in the A-TZ groundwater unit decreased in mass by <99% since 2014. There is no plume in the A-TZ unit. There is no detection of dibenzofuran above RAL.
- B-CZ/B-TZ – The dibenzofuran has decreased by >99% since 2012, the overall trend since 2012 appears to be stable. The majority of the plume mass in the B-CZ/B-TZ groundwater unit is located in the Class 3 groundwater zone (B-CZ) and most of the plume is below the Class 3 groundwater RAL. Plume mass located in the Class 2 groundwater zone is centered around MW-74B and MW-75B within the Englewood Intermodal Yard area.
- C-TZ - The dibenzofuran plume in the C-TZ groundwater unit decreased by >99% in mass from 2007 to 2024. There is no plume in the C-TZ unit. There is no detection of dibenzofuran above RAL.

3.5 Naphthalene

As observed above, the naphthalene plume mass indication decreasing in the A-TZ, B-CZ/B-TZ and C-TZ units. The Spatial Change Indicator™ analyses provided the following results:

- A-TZ - The naphthalene plume in the A-TZ groundwater unit decreased 97% since 2014. The majority of the mass decrease occurred in the areas downgradient to the northeast.
- B-CZ/B-TZ - The naphthalene plume has decreased by 85% since 2012, the overall trend since 2012 appears to be decreasing. The B-TZ unit appears to be decreasing in all areas, except the area surrounding MW-32B and MW-70B, which are both creosote DNAPL recovery wells and typically have DNAPL present in the wells Historic data from these wells does not indicate an increasing trend and these values are primarily below the Class 3 groundwater RAL.
- C-TZ – The Naphthalene plume in the C-TZ groundwater unit decreased by 85% in mass from 2007 to 2024. There are only a few scattered detections of naphthalene above the RAL, with one increase in concentration at MW-18C, historically showing a decrease.
